

Geological and Hydrological Conditions of Hanoi City – An Overview from Urban Planning Point of View

**Dr. Do Minh Duc
M.Sc. Tran Thi Luu**

Hanoi University of Science

Main content

1. Background
2. Geology
3. Hydrogeology
4. Conflicts between development and the Environment
5. Proposals

I. BACKGROUND

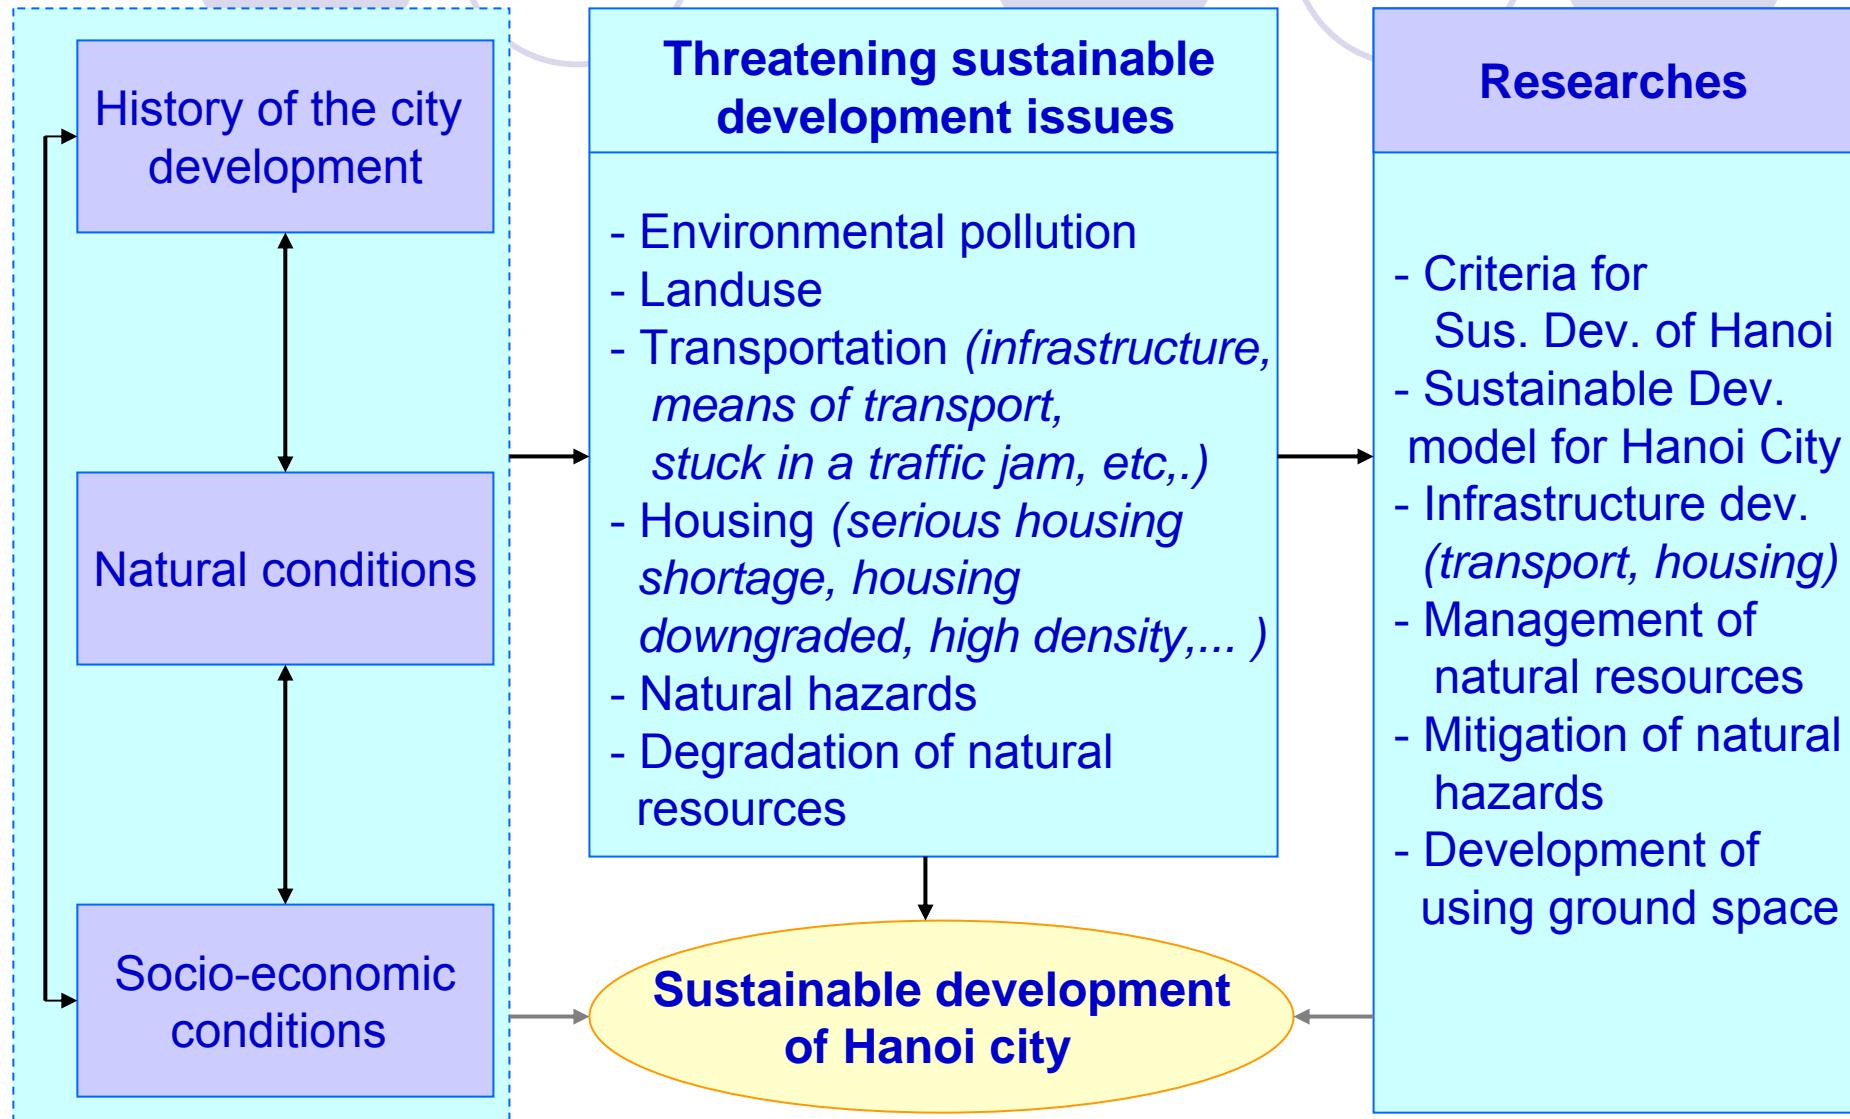

CRITERIA OF A SUSTAINABLE URBAN AREA

A sustainable city is a city which meets the following basic criteria:

- A part of a larger sustainable area
- Being highly competitive
- Having good management
- Having healthy settlement areas
- Having health financial situation

(The World Bank, 2000)

Integrated Approach

METHODOLOGY

Factors

- **Topography**
 - Slope (degrees)
 - Elevation (m)
- **Geodynamics**
 - Uplifting/Subsidence
 - Distance to fault(m)
- **Engineering Geology**
 - Surfical Geology
- **Groundwater**
 - Depth to groundwater level (m)
 - Corrosive potential of groundwater
 - Distance to intensive groundwater extraction area
- **Geological hazards**
 - Earthquake (M)
 - Distance to river bank erosion (m)
 - Distance to river dike segment (m)
- **Man-induced hazards (full or partial)**
 - Land subsidence
 - Inundation (depth under water level –m)

INTRODUCTION OF HANOI AREA

From 1 August 2008:

Area of Hanoi Capital including of Hanoi capital, Ha Tay Province, Me Linh District (Vinh Phuc Province) and 4 communes as Yen Trung, Yen Binh, Dong Tien, Dong Xuan (Luong Son District, Vinh Phuc Province)

Located in coordinate of:

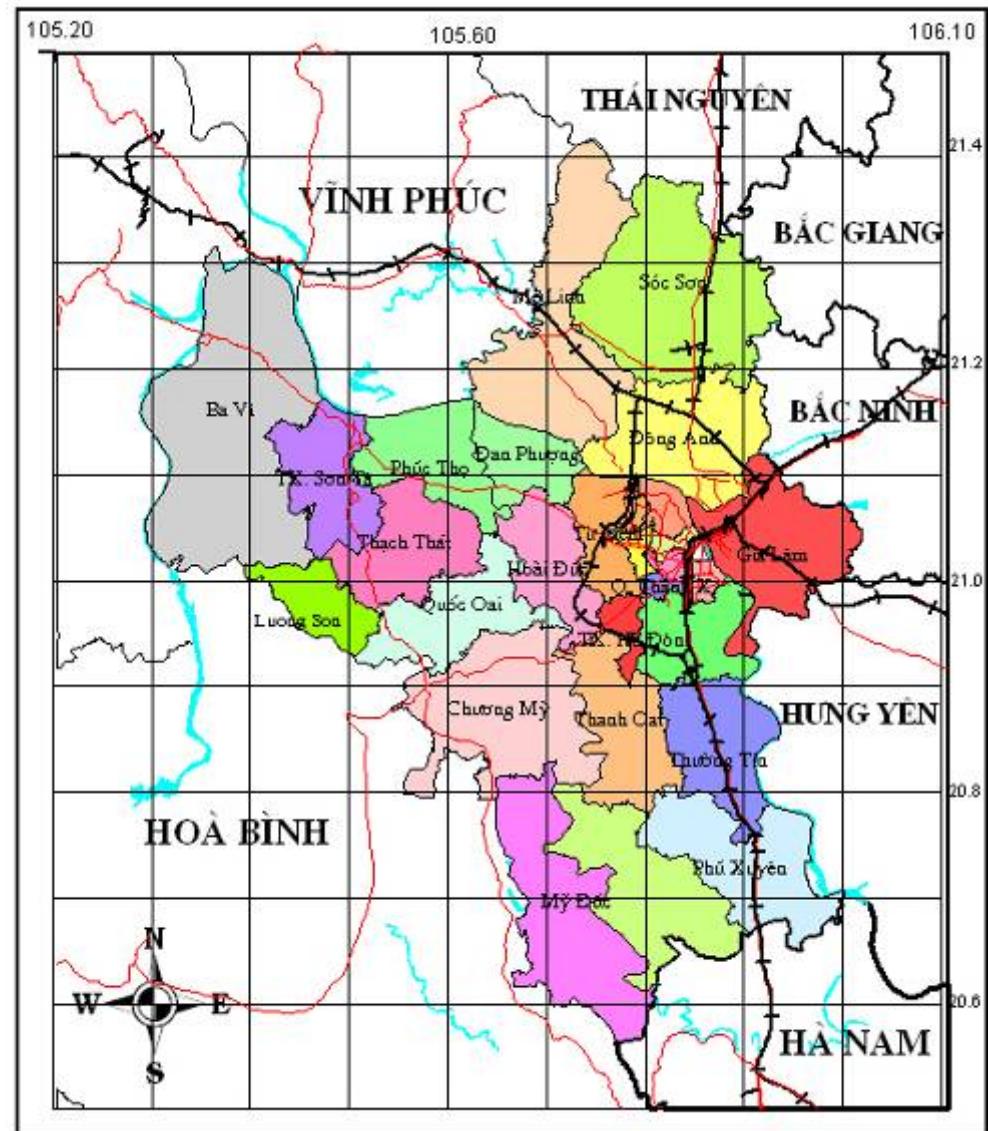

$20^{\circ}33'$ - $21^{\circ}25'$

$105^{\circ}17'$ - $106^{\circ}02'$

Area: about 3.300km^2

Population: 6.232.940 (pers.)

Number of District: 27

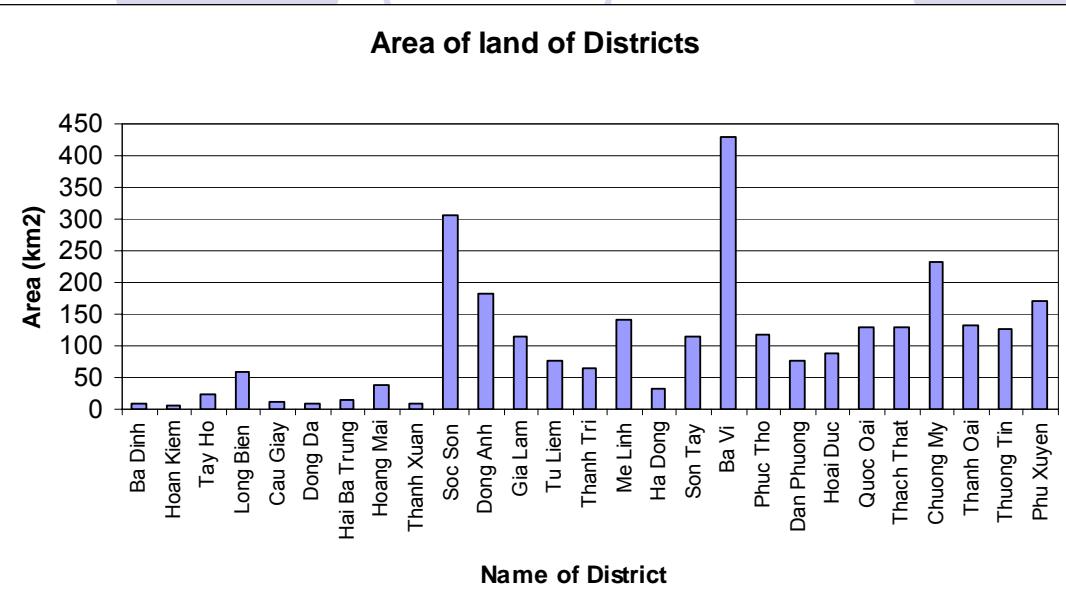

The map of Hanoi area

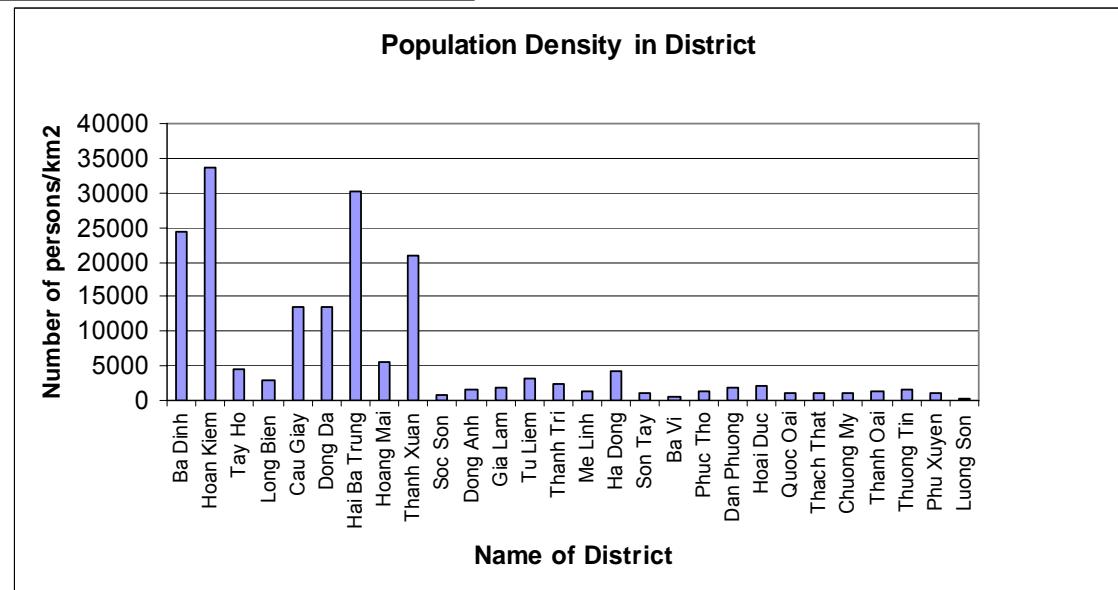

INTRODUCTION OF HANOI AREA

No.	Area	Area of land (km2)	Average Population	Density (pers./km2)	No.	Area	Area of land (km2)	Average Population	Density (pers./km2)

ECONOMIC CONDITION

Study Area

Hanoi City

Area : 920.97 (km²)

Population : 3,082,800 (2004)

Structure of Urban Land

- Population density = Level of Concentration on Development

- Population growth rate = Level of Development Pressure

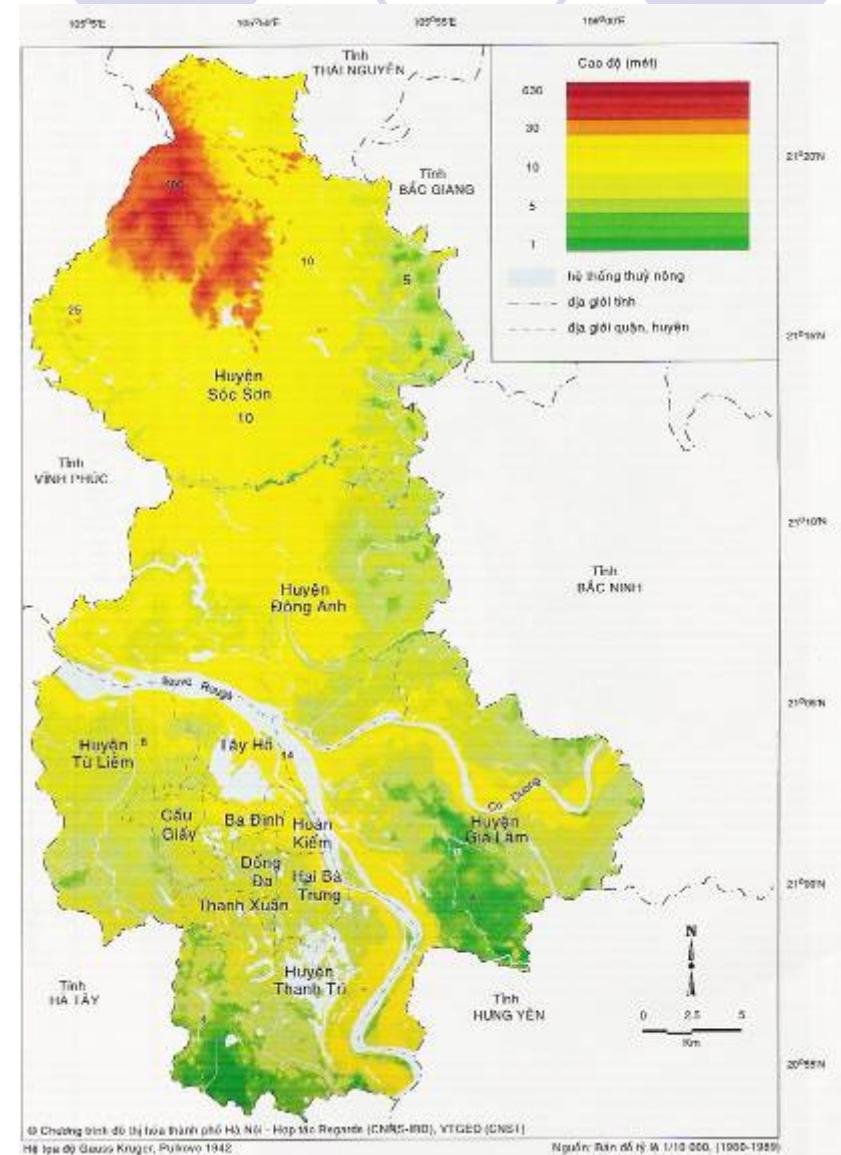

Type of Urban Land

Type	Area (km ²)	Population				Pop Density (2003) : perso n/ha	Pop. Growth Rate %/yr		
		1999		2003					
		'000	%	'000	%				
Urban Core	34.5	963	36.0	1,053	35.0	305	2.3		
Urban Fringe	141.9	673	25.2	827	27.5	57	5.3		
Sub urban	140.5	342	12.8	392	13.0	28	3.4		
Rural	604.1	695	26.0	735	24.5	12	1.4		
Hanoi Capital	921.0	2,675	100.0	3,008	100.0	33	3.0		

TOPOGRAPHY

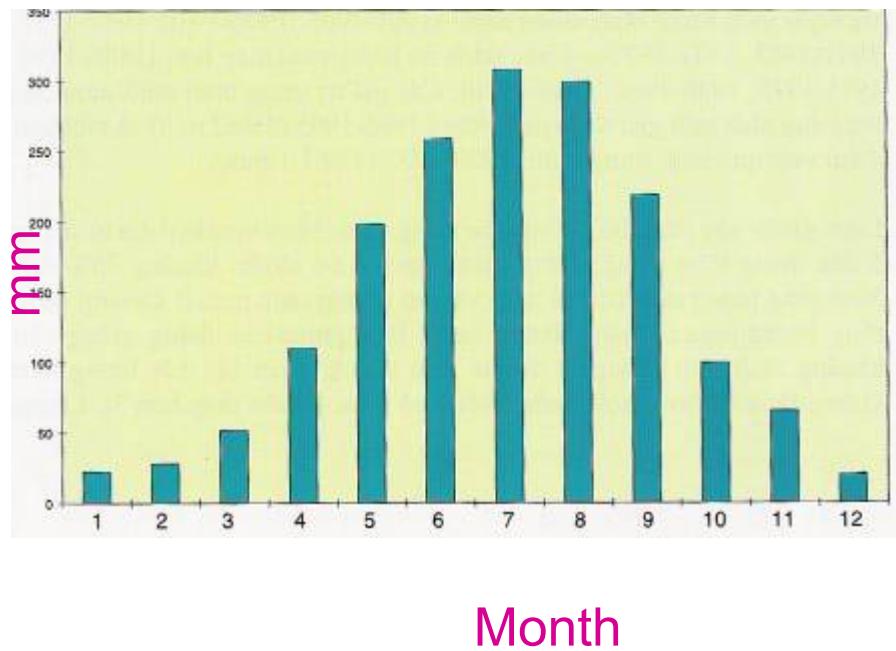

- Most of the area of Hanoi has the average elevation of 5-20m above sea level. The rest covering only the northern and northwestern parts of Soc Son district is mountainous with elevation of 20 - 400m, maximum 462m (the Chan Chim mountain peak).
- The topography of Hanoi lowers from north to south and from west to east. This is reflected clearly through the flow direction of the main river flowing across Hanoi.

climate

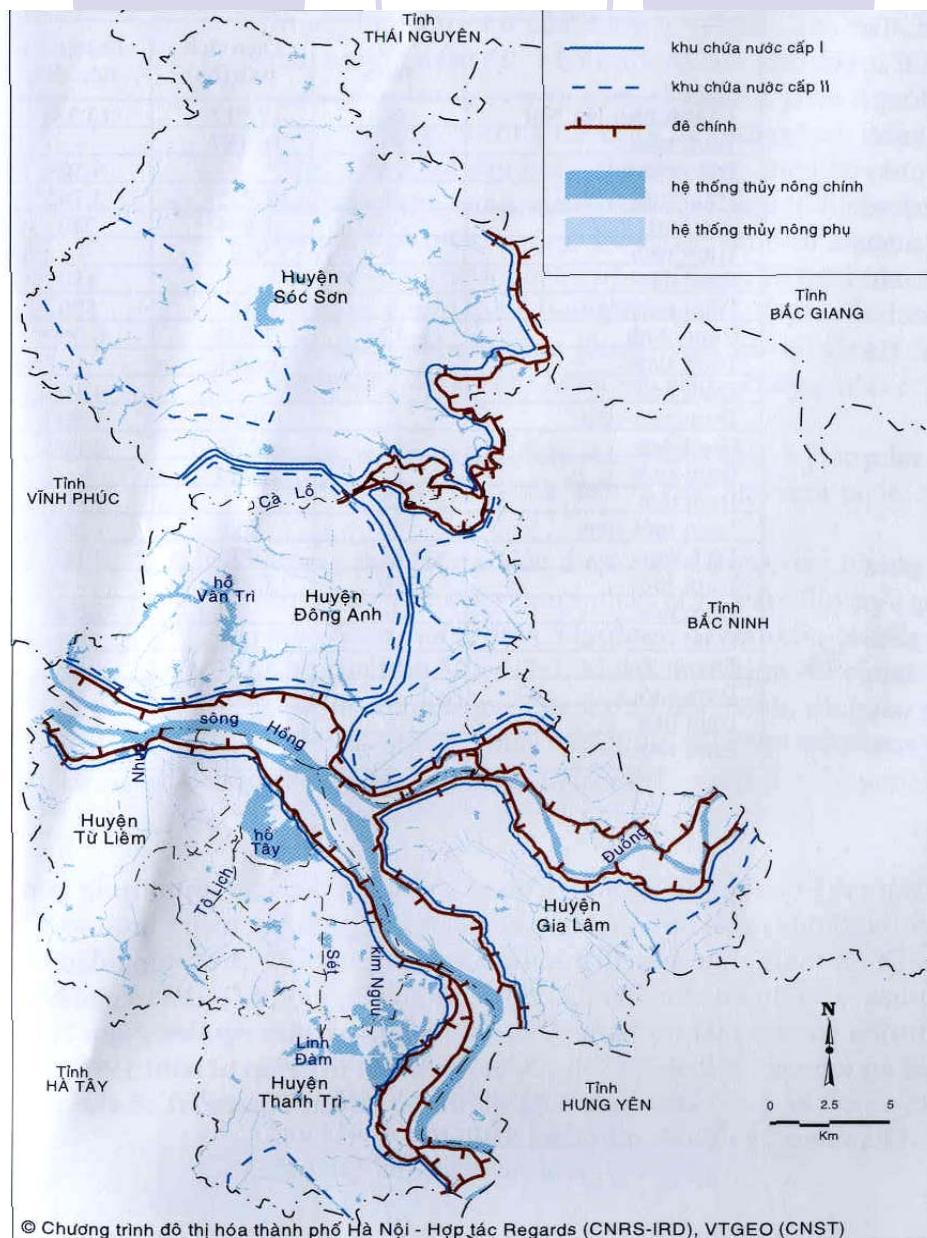

- The climate of Hanoi bears the humid tropical monsoon characteristics, with hot and wet summer and cold and dry winter. The annual mean relative humidity is 84% and the rainfall is 1676mm
- The summer lasts from May to September, characterized by high temperature and rainfall with dominantly southeast wind direction. During this period, the highest average temperature occurs in July (28.90C) and the highest average rainfall occurs in august/july (318mm)

Average rainfall from 1986-1997

Hydrology

- River: 157km in total length
- Big rivers: (drainage and irrigation rivers): Hong, Duong, Nhue & others (a branch of Hong river), water quality is rather good.
- 4 small rivers (drainage river):
 - To Lich, Kim Nguu, Lu and Set rivers are the main drainage for waste water of the city.
 - Total length: 38.8 km

Hydrologic characteristics

	Rivers	Lakes
Number	10	111 (24 lakes -inner city)
Area or length	157.7 km	2180 ha
	Total length of 36.8 km for 4 main drainage axes : Tolich, Kim Nguu, Set, Lu	The largest West Lake (516 ha), then Linh Dam Lake (52.2 ha).

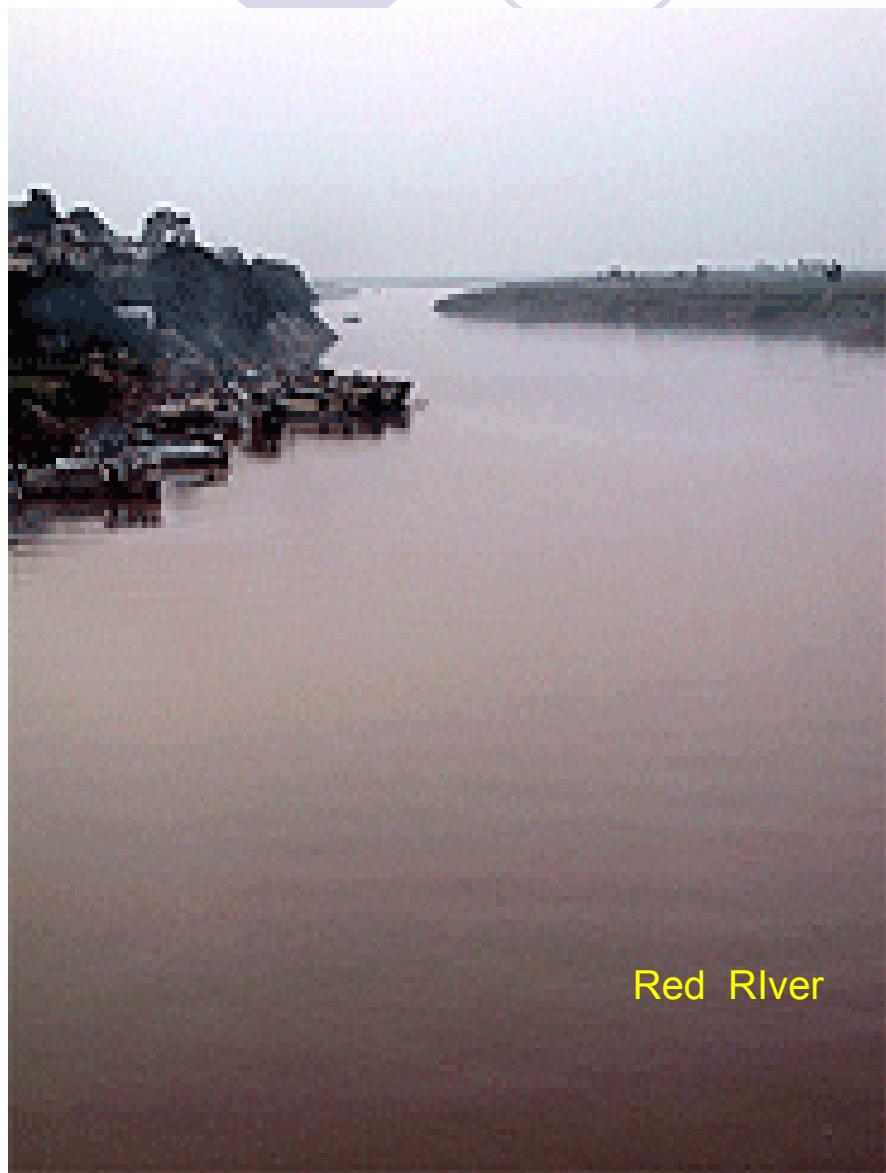

Hoan Kiem Lake

West Lake

Hydrology

The functions of some lakes

No.	Lakes	Main function
1	West Lake	Tourism, entertainment, climate regulation, pisciculture
2	Truc Bach	
3	Thu Le	
4	Bay Mau	
5	VanChuong	
6	Giang Vo	Holding waste waters
8	Thanh Nhan	
7	Ba Mau	Holding rain and waste waters

2. Geological condition of Hanoi City

During the Quaternary period (1.6 Ma to present), most of the land of Hanoi has been created through transgressions and regressions of the sea in 5 depositional cycles

- Cycle 1: From 1.6 to 0.7Ma, the Lechi formation, early Pleistocene (Q_1^1 lc).
- Cycle 2: From mid - late Pleistocene, the Hanoi formation (Q_1^{2-3} hn)
- Cycle 3: From late Pleistocene, Vinhphuc formation (Q_1^3 vp)
- Cycle 4: From late Pleistocene to early Holocen, Haihung formation (Q_2^{1-2} hh)
- Cycle 5: From late Holocen to present, Thaibinh formation(Q_2^2 tb)

Engineering geological Conditions

Hanoi background was divided into 4 groups, basing on its characteristics, distributed depths, thick and geohydrography conditions

1. ***Group I - Very good for constructions:***

- Distributed all Dong Anh and Tu Liem dist,
- Quite flat, good drainage
- Compositions: clay, clay with sand, sand with clay
Pleistoxen age with high mechanical and physical indexes.
- Groundwater: < 5m.

2. ***Group II - Good for constructions:***

- ✓ Distributed inner city, along To Lich, Hong, Duong river, most of Gia Lam dist.
- ✓ Quite flat or be local cut in somewhere.
- ✓ Compositions: clay, clay with sand, sand with clay Holocene age
- ✓ Good or medium mechanical and physical indexes
- ✓ Groundwater: 2 - 5m

Engineering geological Conditions

Hanoi background was devided into 4 groups, basing on its characteristics, distributed depths, thick and geohydrography conditions

3. ***Group III - Medium***

- ✓ Distributed all Thanh Tri and a part of Gia Lam dist (near Hong river) and some areas in Dong Anh , Tu Liem dist.
- ✓ Quite bad topography, hollow surface.
- ✓ Compositions: Mud and organic soils
- ✓ Bad mechanical, physical indexes and drainage
- ✓ Ground water may erode concrete

4. ***Group VI - Bad for constructions***

- Distributed between Hong and Duong river dykes.
- Always flooding in rain season.
- Very bad mechanical, physical indexes,
- Never good for constructions.

Engineering geological Conditions

Hanoi background are divided into 4 zones, based on its characteristics, distributed depths, thicks and geohydrography conditions

1. Zone I - Very favorable for construction

2. Zone II - Favorable for construction

3. Zone III - Less favorable for construction

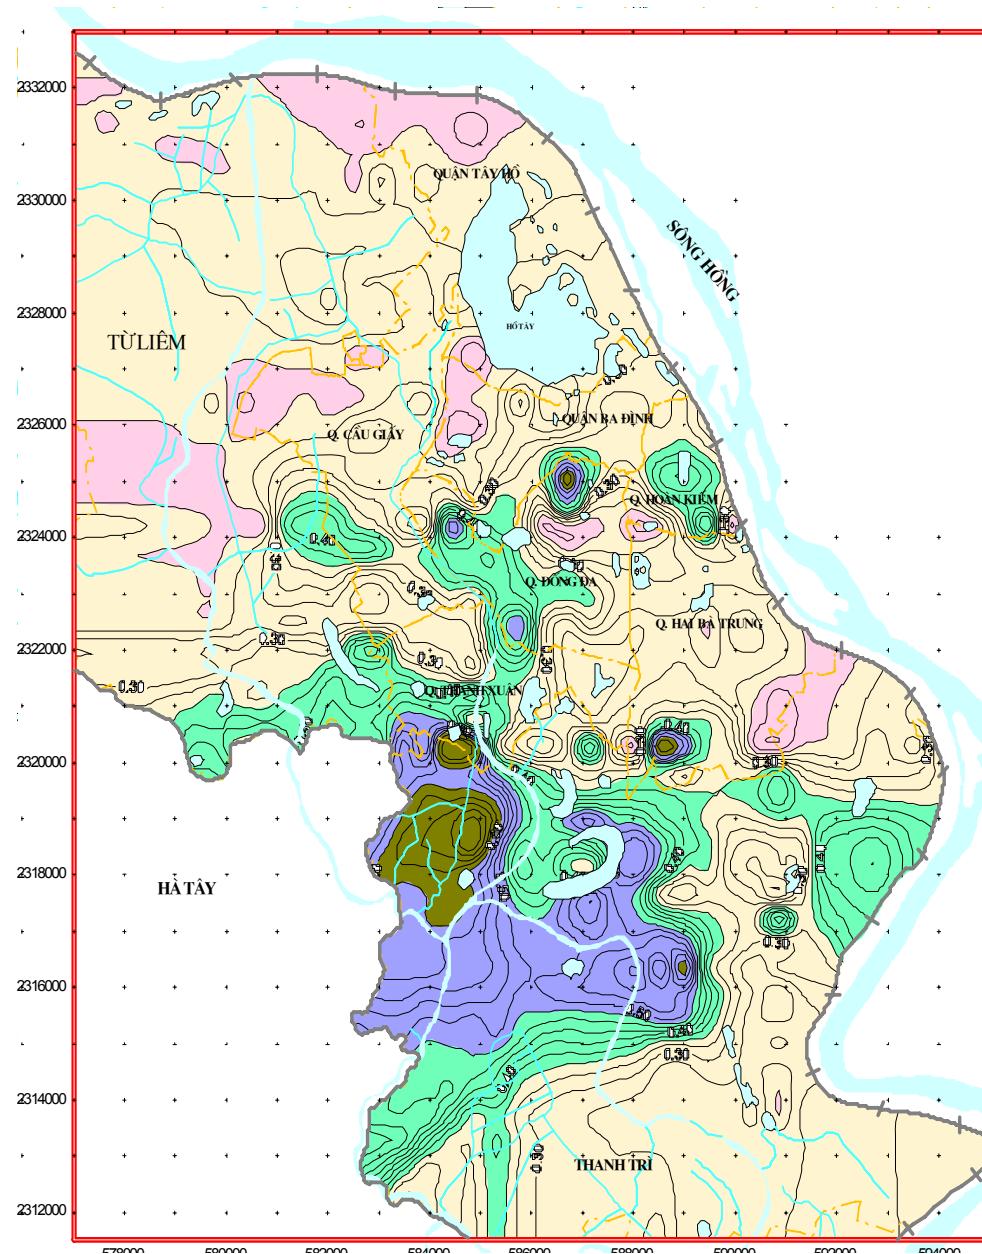

4. Zone VI - Not favorable for construction

Engineering geological Conditions

Hanoi

- Very good
- Good
- Medium
- Poor
- Very poor

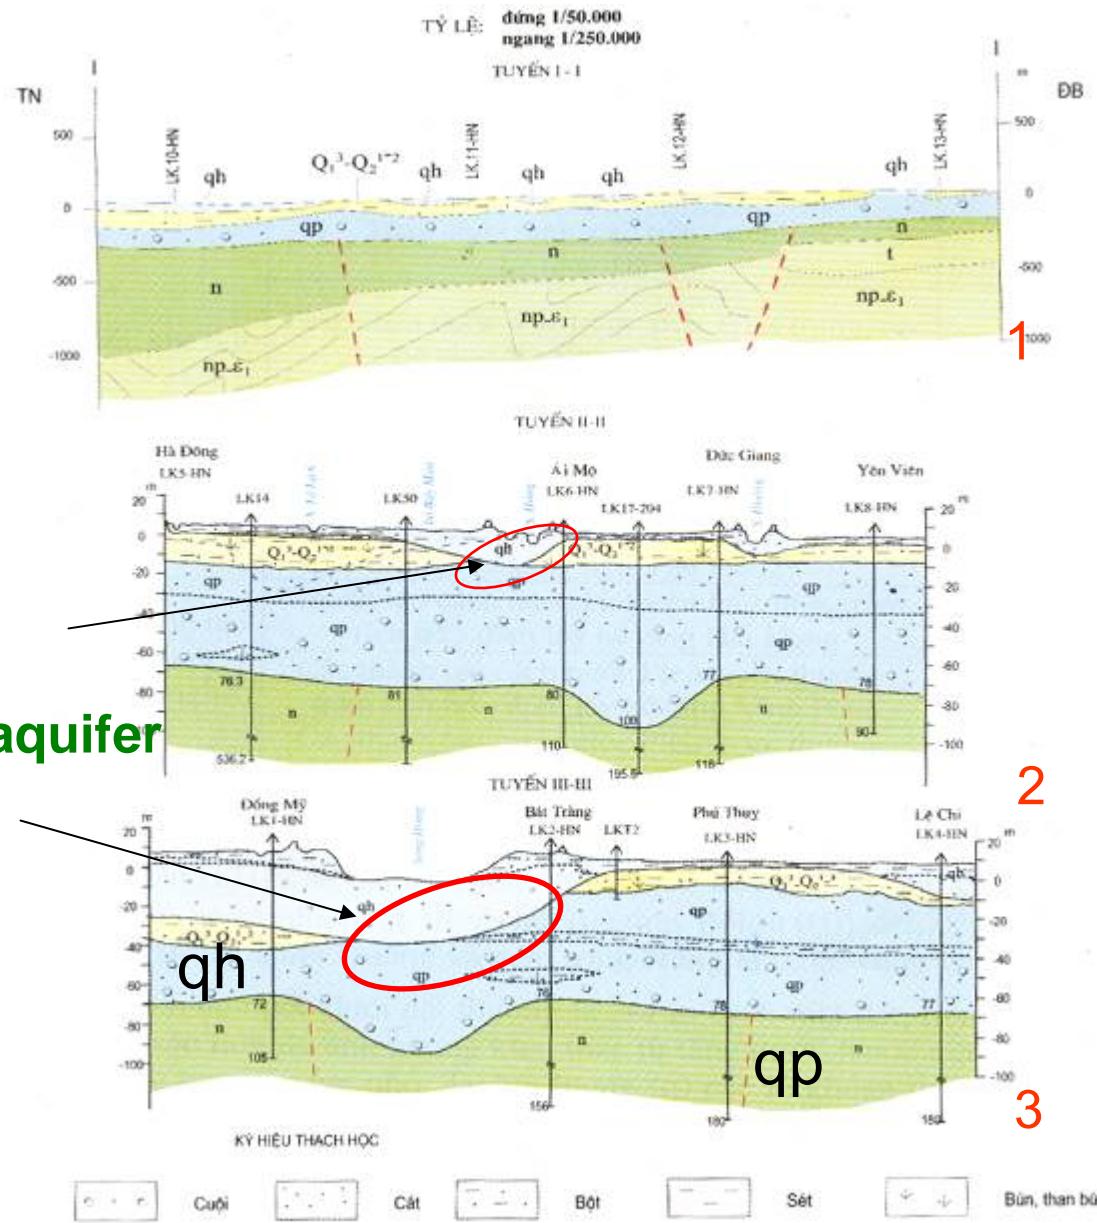

3. Hydrogeological condition

	qh aquifer	qp aquifer
Location	from the Red and Duong Rivers southward	from the south of the Soc Son District southward
Total area (Km ²)	530	>700
Composition of sediment	weakly permeable silty clay, silty sand	Sand, sand mixed with grit and gravel
	Sand, sand mixed with grit and gravel	Gravel mixed with grit and sand
The depth of the groundwater level (m)	3-4	2-35
Supplying significance	poor	very rich

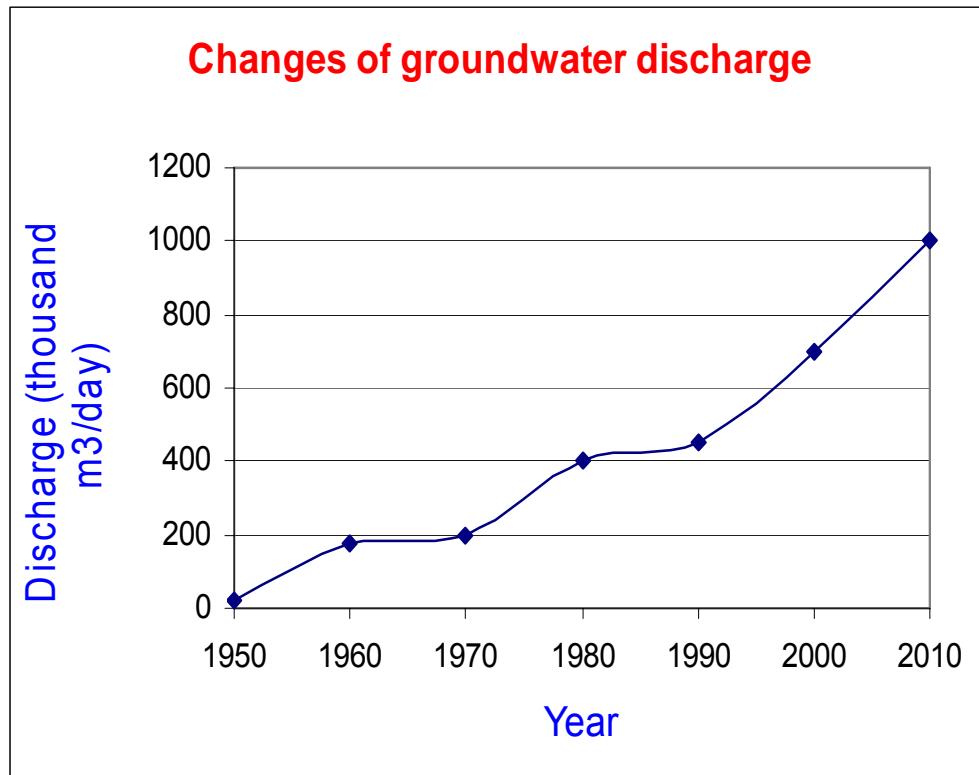

Hydrogeological cross section

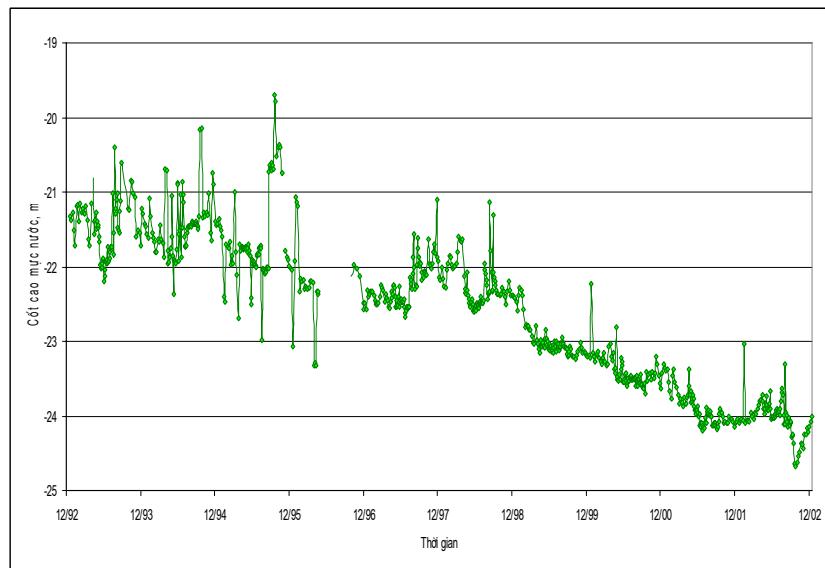

Groundwater exploitation

- Began to exploit groundwater for serving the living demand since 1909.
- Up to present time, the quantity of drill wells and exploiting capacity continually increase

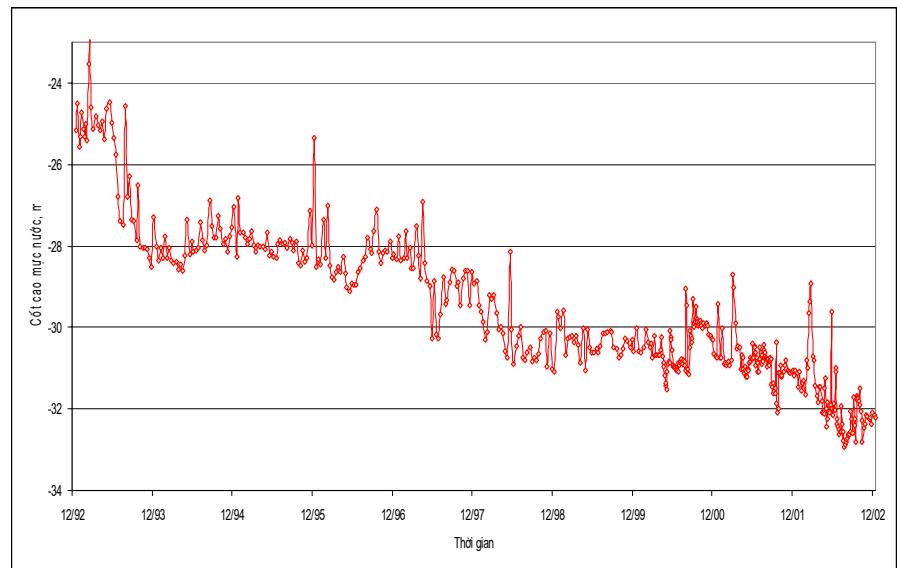

Change of groundwater level due to exploitation

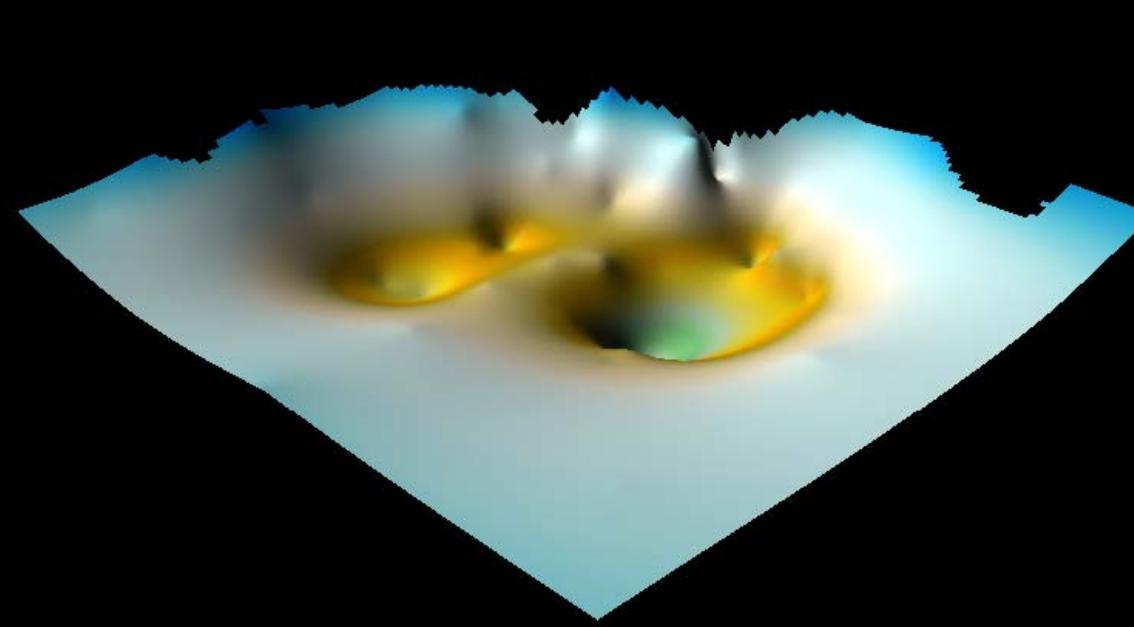

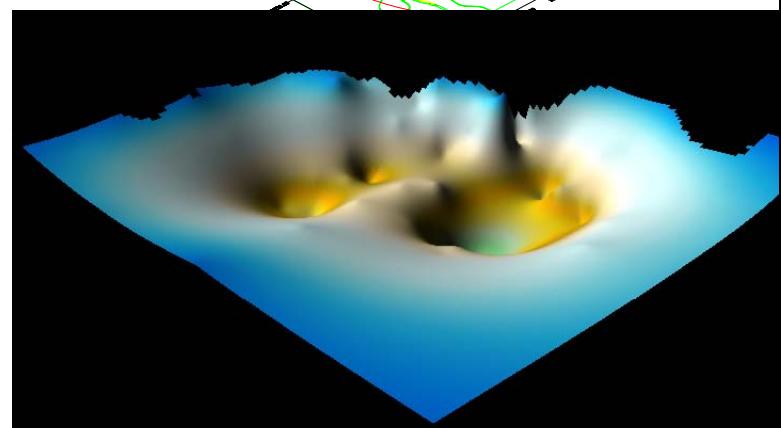

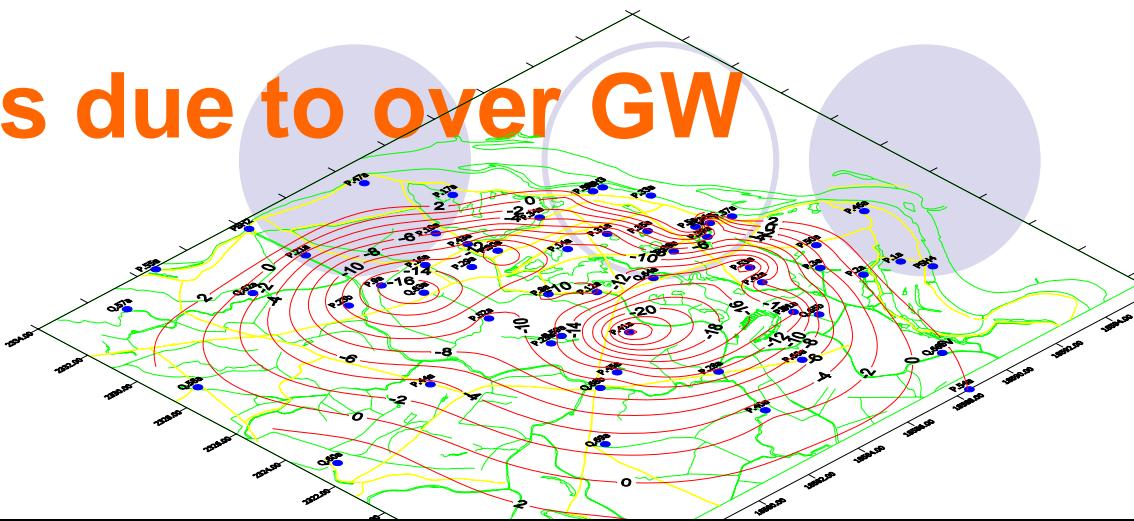

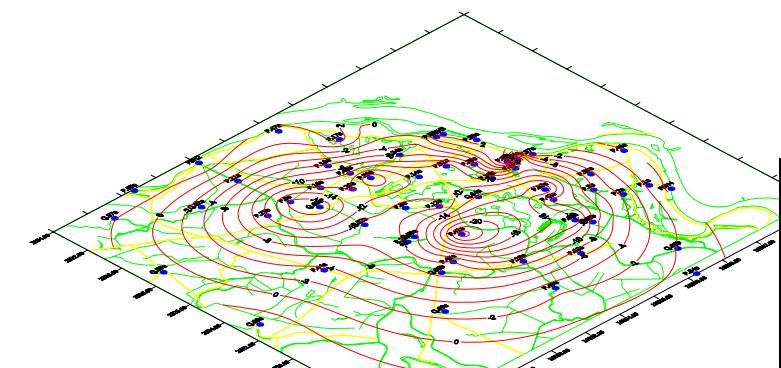

Ngoc Ha

Ha Dinh

Depression cones due to over GW exploitation

Diện tích phễu <-14m : 29.01 Km²

2 Đường thuỷ đẳng áp

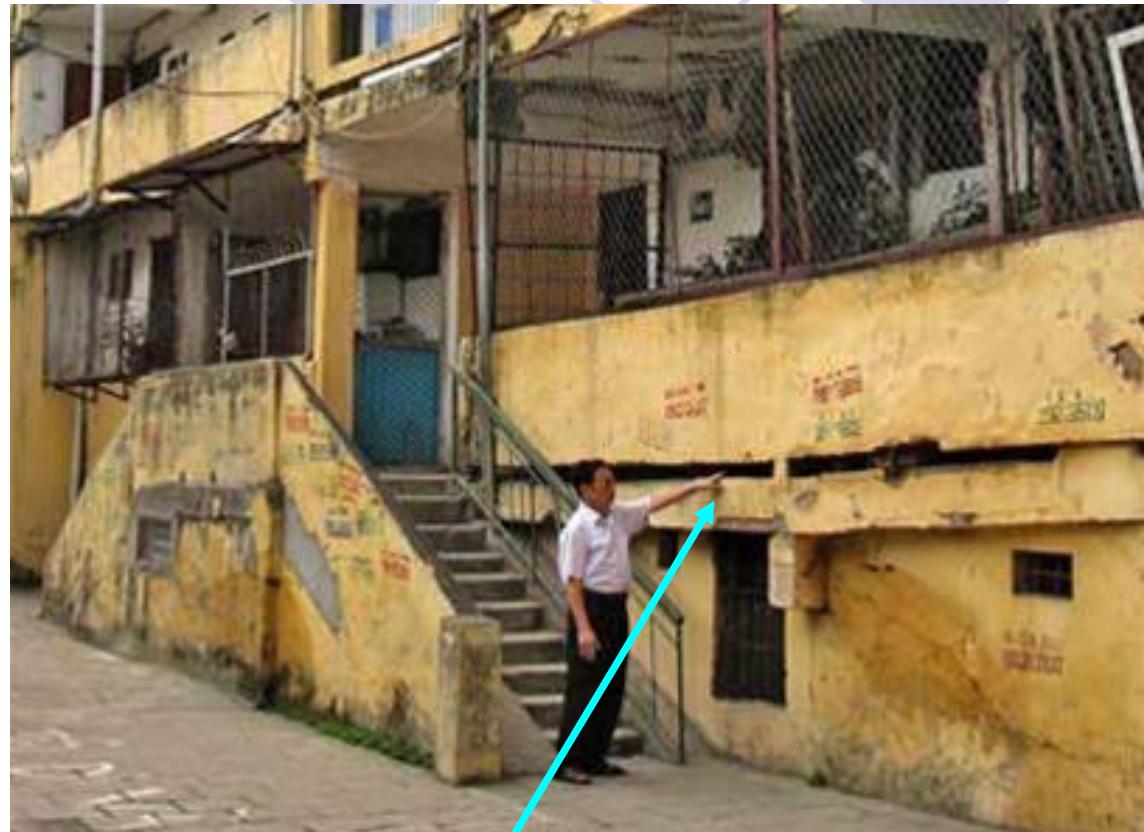

Diện tích phễu <-14m : 29.71 Km²

2 Đường thuỷ đẳng áp

Land subsidence due to over GW exploitation

Subsident rate

1. Thanh Cong, Ba Dinh area: 4.5cm/year
2. Ha Dinh: 3cm/year
3. Pháp Vân, Hạ Đình, Tương Mai, Văn Điển, Mai Dịch: 2cm/year

Land subsidence in Thanh Cong area
The first floor is now only 1.5m in height

4. Conflicts between development and the Environment

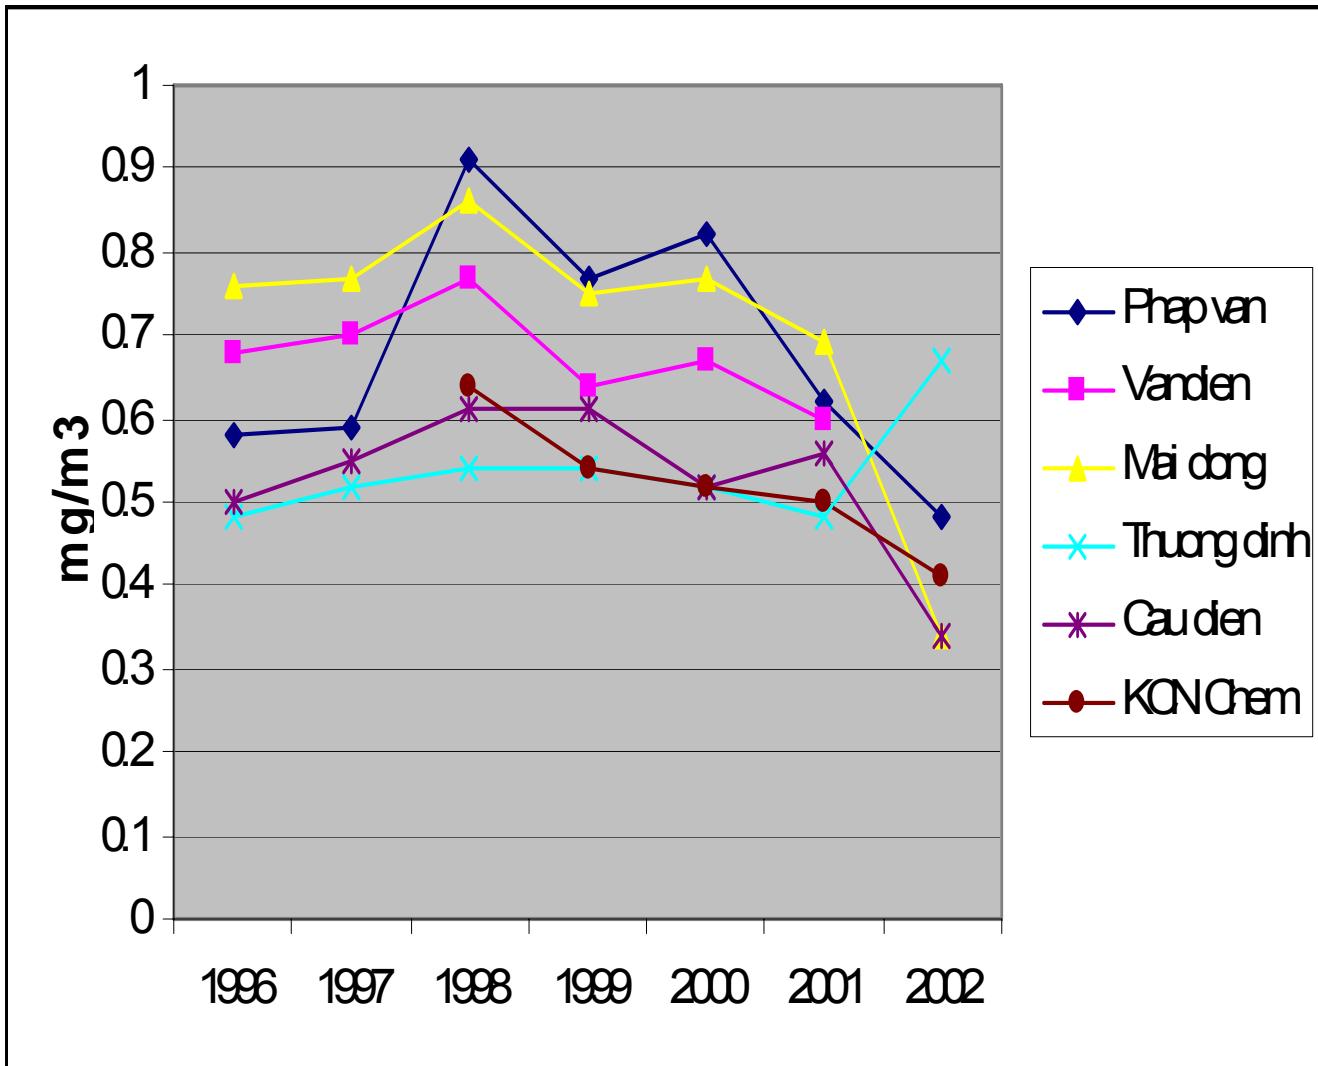

- ✓ Quality of Air, Water and Land
- ✓ Disaster Vulnerability
- ✓ Social and Cultural changes

Air Environment

- Concentration of dust: over the allowance 2.5-4.5 times, most of industrial zones tend to decrease,
- Inner city manifests to pollute of SO_2 , NO_x , ...
- By 2010, air pollution caused by industry decrease in inner city
- By 2020, most of parts of streets polluted

Concentration of dust in some industrial zones of Hanoi

Air Environment

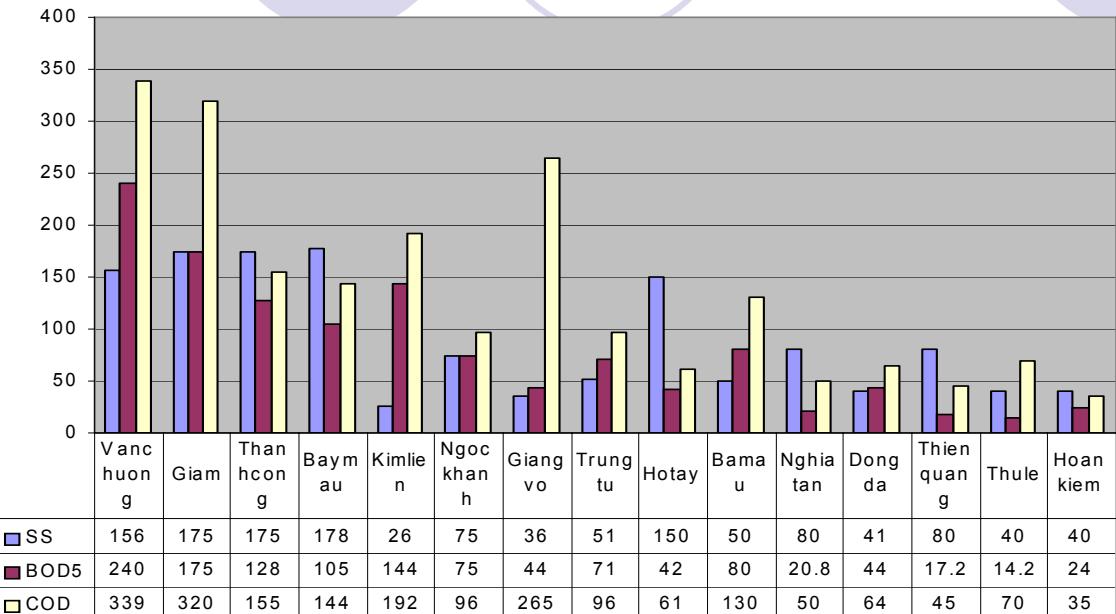

- Noise

- Industry: Intending to decrease.
- Transportation: increasing slowly

GROUNDWATER POLLUTION

Ammonium

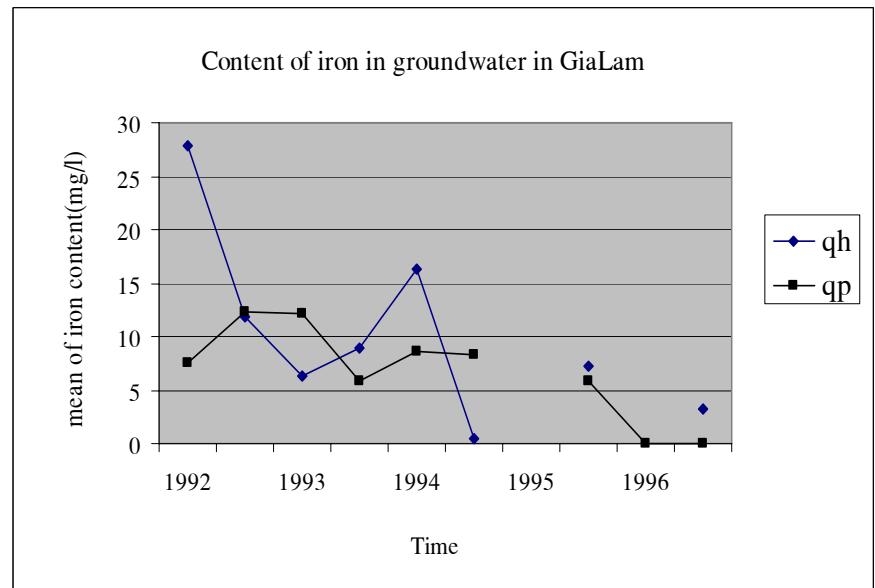

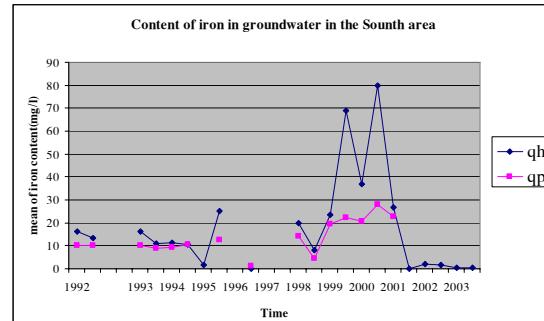

Found in all parts of the city: southen, northen and GiaLam.

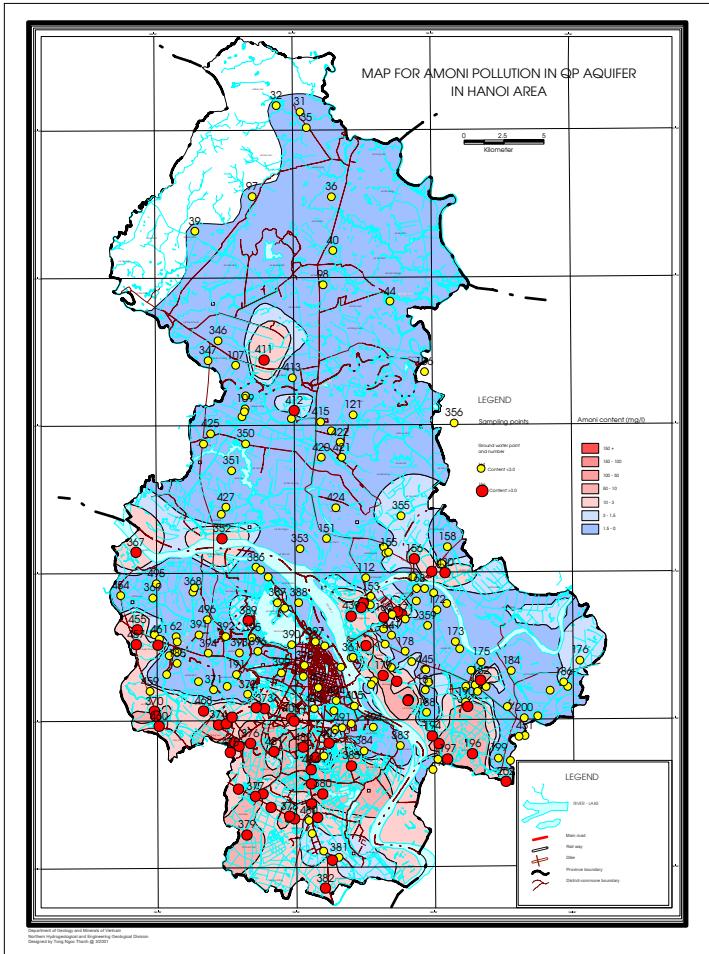

GROUNDWATER POLLUTION

Iron

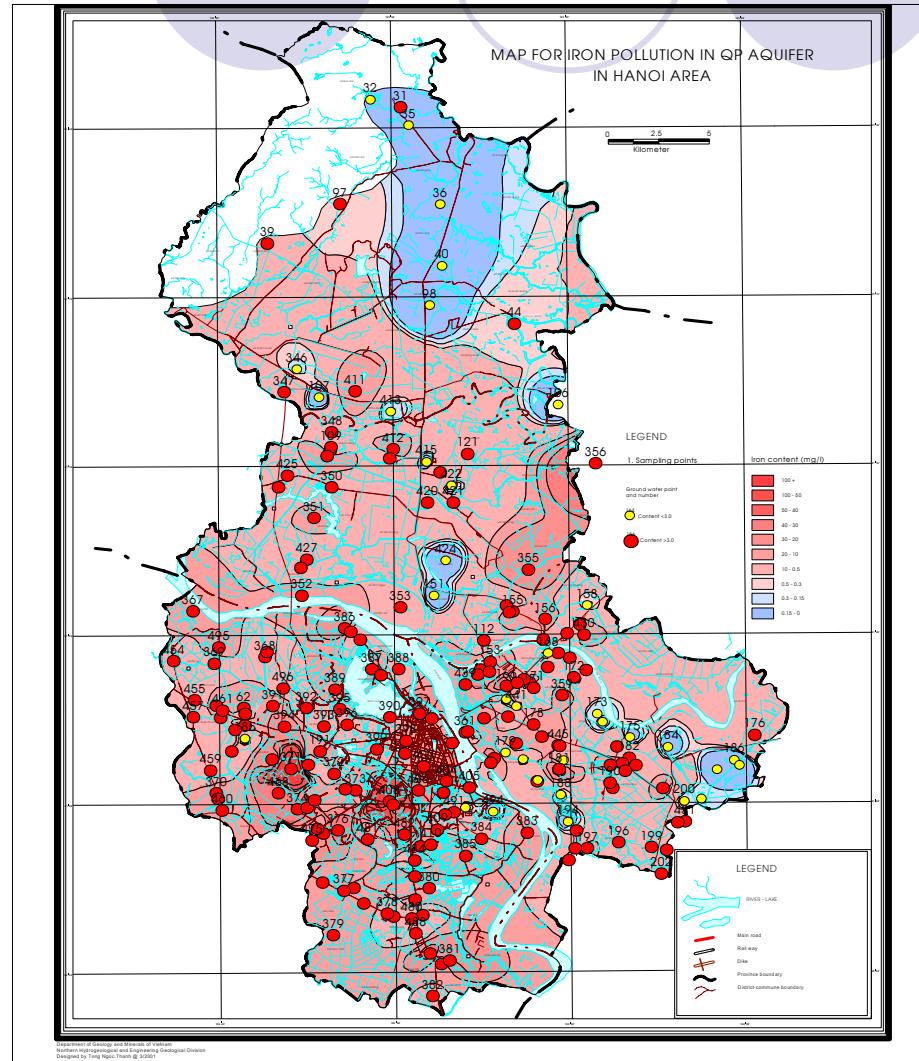

- Both aquifers and all parts of Hanoi city contain high iron.
- The southern part of the city is the most serious groundwater pollution by iron and then Gia Lam and the last is the north area.

Maps of iron and ammonium pollution of Groundwater

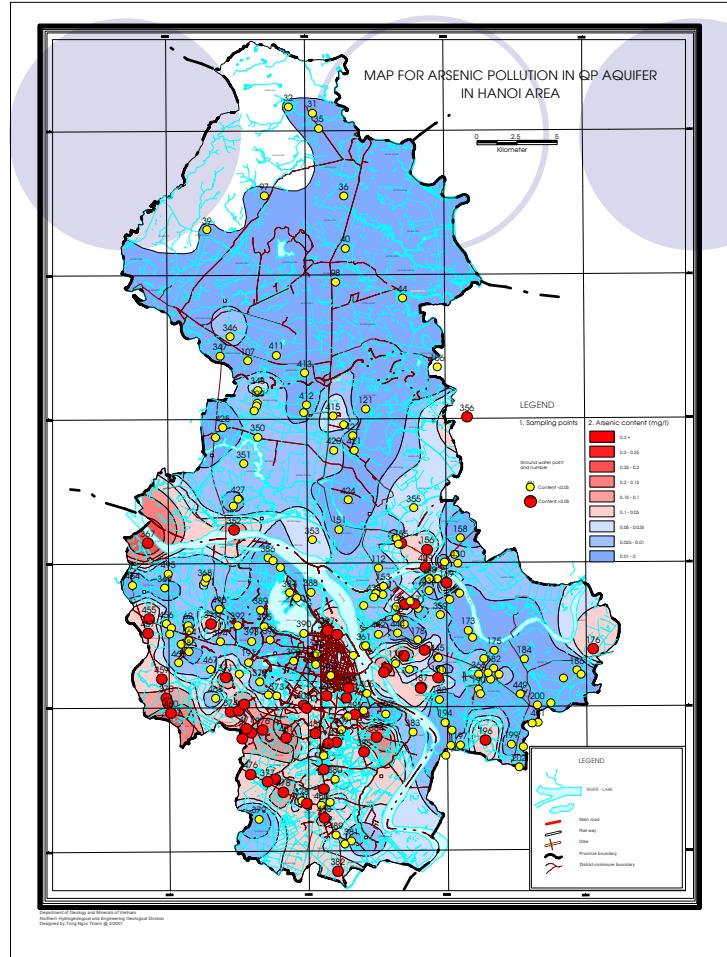

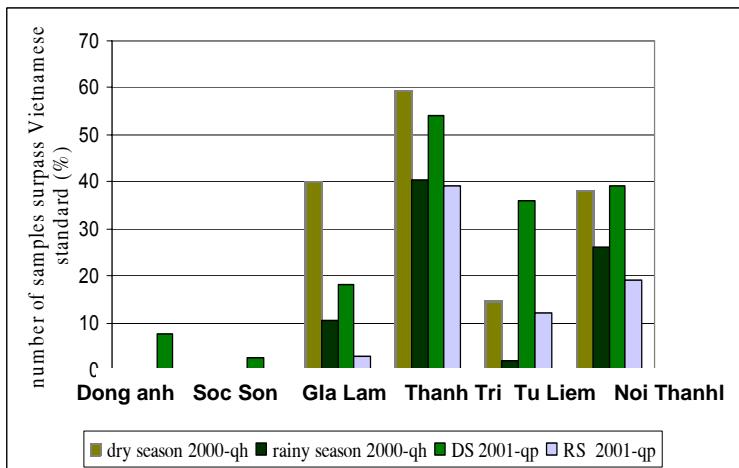

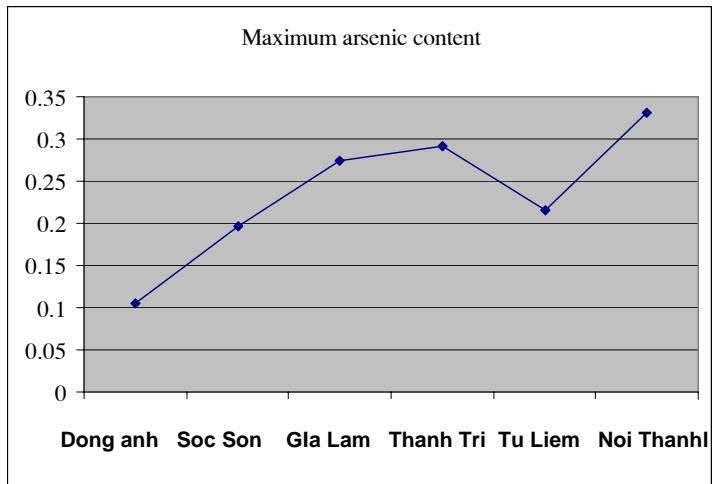

Ammonium

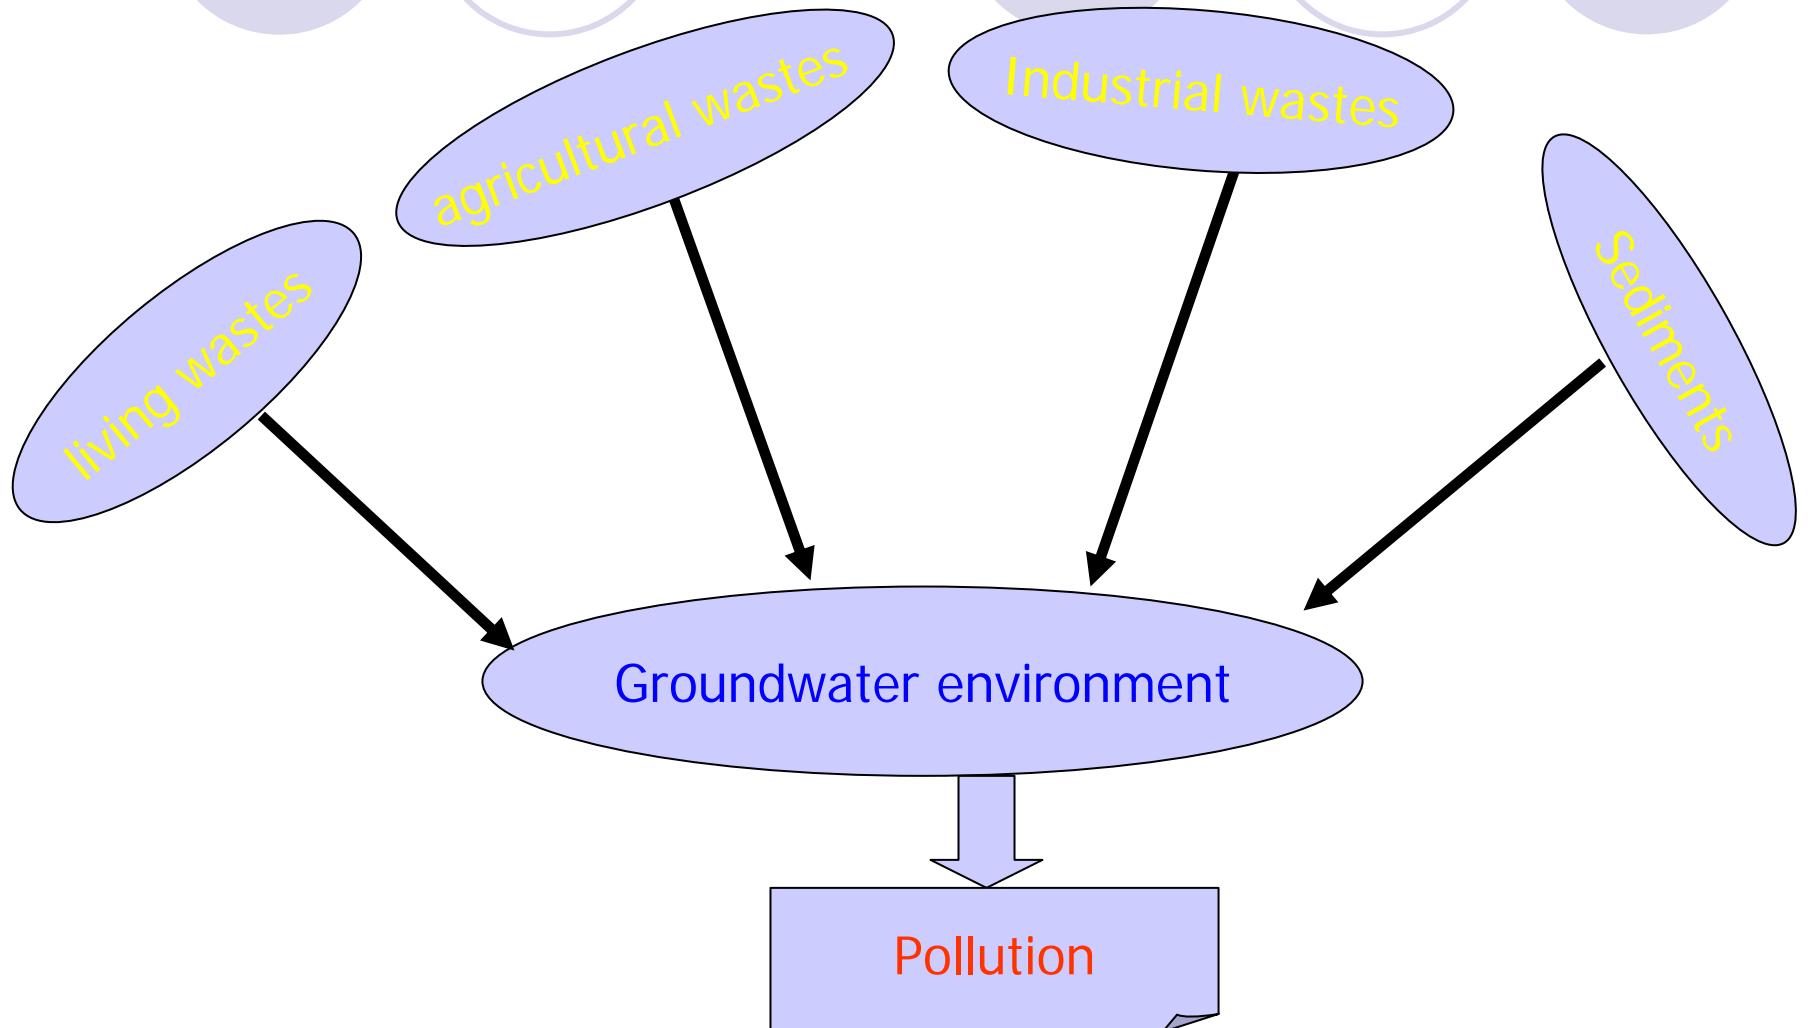

IRON

Arsenic pollution in Groundwater

- Found in almost area of the city, especially the southern part such as Thanh Tri, Tu Liem areas and inner city is the most seriously polluted.
- The content of arsenic in groundwater increases with time.

The source of groundwater pollution

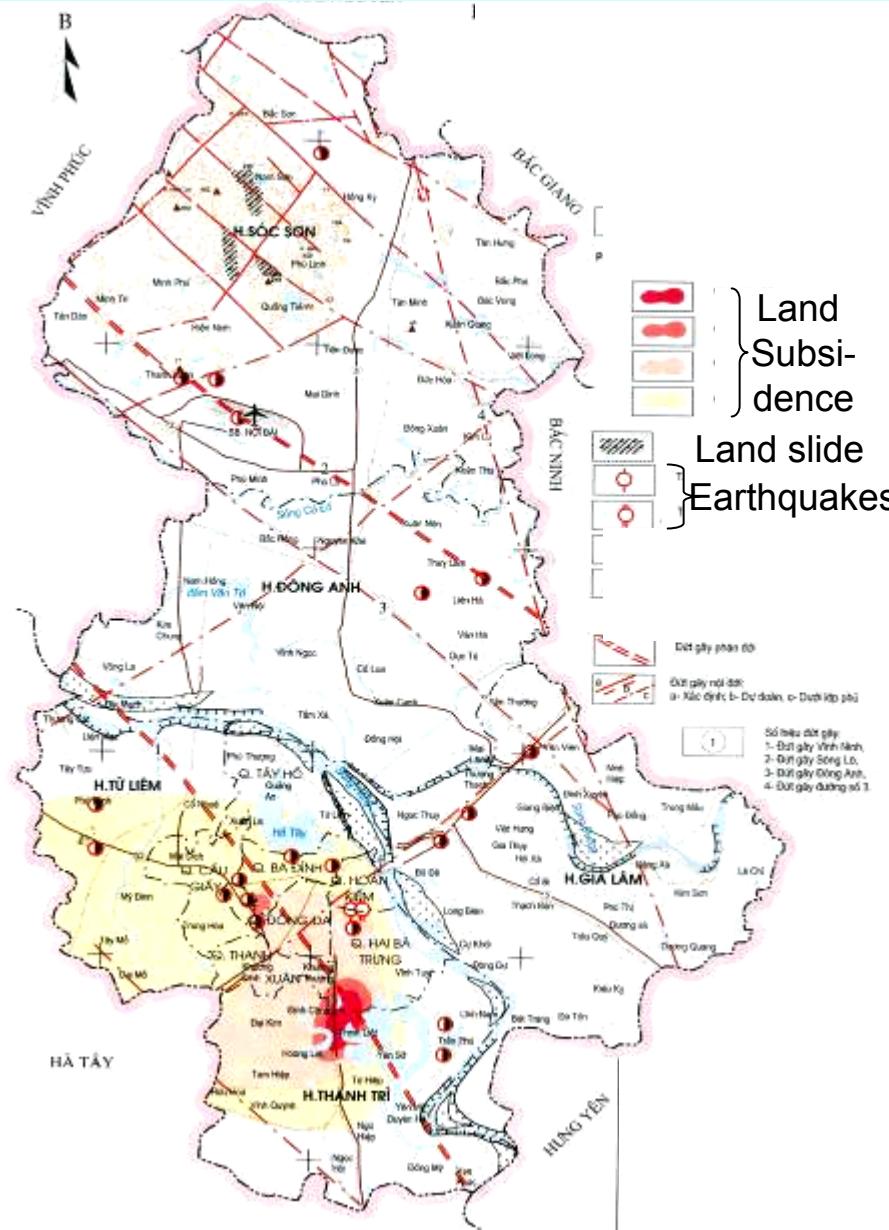

Natural hazards

Short-term harzads

- Storm
- Flood
- Inundation

Long-term hazards

- River bank erosion
- Sedimentation
- Land subsidence
- Earthquake

Natural hazards

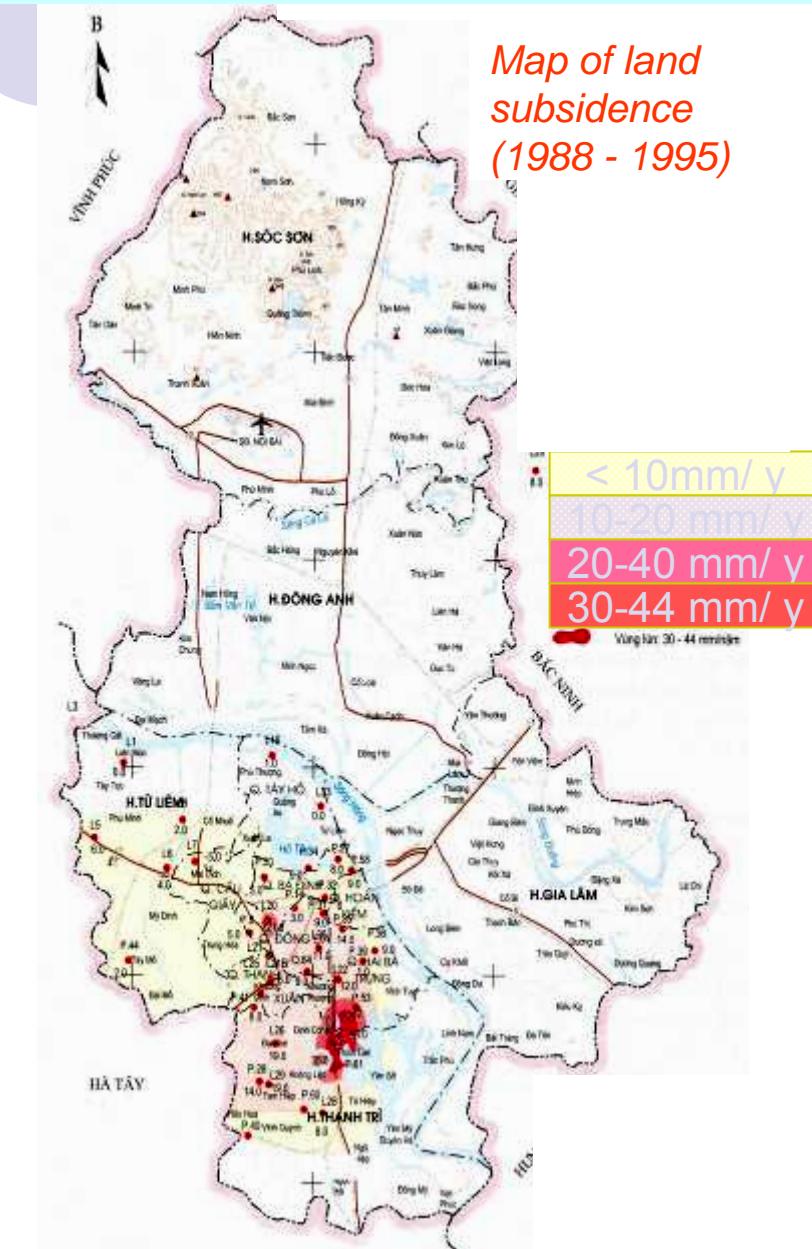

River bank erosion

Natural hazards

Land subsidence

- ✓ The most intensive subsidence in Hanoi by 1999 : 35 - 40 mm/year
- ✓ In most of the remaining area, the 20mm – 25mm/year
- ✓ In the Northern part: 10mm/year,
- ✓ The area along the Red river is not subsided.

Natural hazards

Earthquakes

There are over 130 earthquakes from 1277 to present:

- ☞ 3 reached the magnitude of 5.1 in Richter scale (*in 1277, 1278, 1285*)
- ☞ 1 reached the magnitude of 5.3 in Vinhphuc province in 1958 (*about 60 km from Hanoi*)
- ☞ 1 with magnitude of 5.6 in Bacgiang in 1961 (*about 60 km from Hanoi*)
- ☞ *Hanoi city lies in the zone with possible earthquake of 7 to 8 M degree*

5. BASIC STRATEGIES

1. Respecting the features of water-city as the identity of Hanoi wide area, building up new Hanoi as ecocity, based on Day River- and lakes-centered planning.
 2. Focusing the potential of handicraft villages scattered in the suburbs of Hanoi wide area
 3. Maintaining and utilizing the symbol of Hanoi's tradition and vitality; proposal-oriented to help 36 streets district to become a world cultural heritage ratified by the UNESCO

5. BASIC STRATEGIES

4. Maitaining :

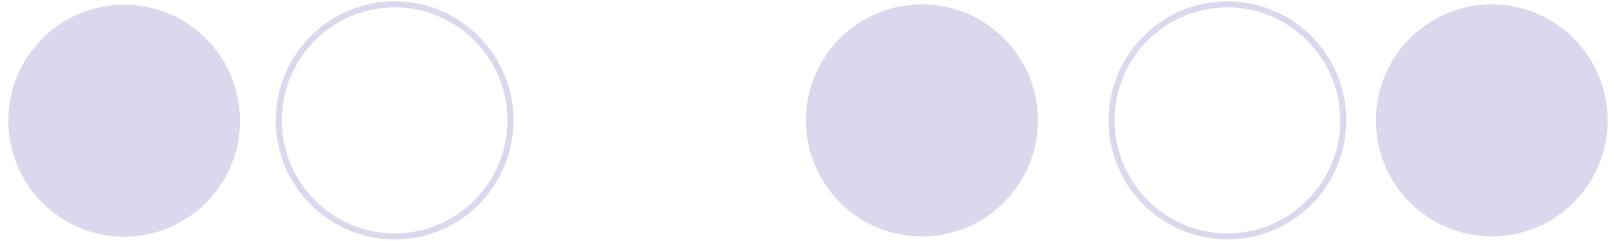

The existing urban area of HN as the historical capital (HC)

And establishing:

An administrative capital about 25-30 km west of the HC (Hoa Lac-Bavi Area).

5. Towards a Better & More Sustainable Living Environment

6. Encouraging international and inter-disciplinary approaches to the city

Thank you for your attention
